

UrbanServe

Home Services Marketplace — Project Scenario Description

IT214 – Database Management System | Autumn 2026 | DA-IICT

1. Team Details

Student ID	Full Name	Role	Contact
202401017	Anuj Madhani	Team Representative	9265657300
202401041	Shane Christian	Member	—
202401061	Hari Patel	Member	—
202401069	Hitansh Patel	Member	—

2. Project Title & Overview

UrbanServe is an on-demand, doorstep home-services marketplace that connects customers with skilled, verified local professionals across categories such as plumbing, electrical work, AC servicing, deep cleaning, carpentry, and salon services. The platform manages the complete service lifecycle — from browsing and booking to provider assignment, OTP-verified delivery, payment processing, and post-service reviews.

3. Project Scope Description

The UrbanServe database captures all essential entities, relationships, and transactions required to operate the platform end-to-end. It maintains a hierarchical service catalog (Categories → Services → Variants with pricing), customer and provider profiles, pin-code-level geographic coverage, and time-slot-based scheduling with real-time availability to prevent double-bookings. It also tracks dynamic pricing, booking and payment records, provider earnings and payout batches, customer reviews and ratings, warranty claims for eligible services, and a full complaint resolution trail.

4. Users & Their Interactions

User	What They Do
Guest	Browses catalog → explores categories → views provider profiles → checks overall ratings.
Customer	Registers → saves address → browses services by category → selects service & variant → picks date/time & provider → applies coupon → places booking → tracks status (Pending → Confirmed → In-Progress → Done) → pays (UPI/Card/Cash/Wallet) → rates provider & service separately.
Service Provider	Registers → uploads ID proofs & certifications → lists offered services with pricing → sets weekly availability slots → receives & confirms bookings → completes service → earns income (minus platform commission) → builds reputation via ratings.
Administrator	Manages cities, areas & service catalog → verifies provider documents → creates/manages discount coupons → monitors bookings → resolves complaints & disputes.

5. Real-World Relevance & Scalability

The system is designed to handle the complex operational logistics and matching requirements inherent in the modern home services sector. It is built to scale smoothly across multiple cities by simply extending geographic coverage data. Furthermore, the database foundation is structured to accommodate future business expansions, such as recurring subscription plans, multi-provider bookings for large jobs, and in-app communication, ensuring it remains highly adaptable to growing real-world business needs.
